

GRAV

Store & Purchase

Complete user guide

From an approved need to supplier order, receipt, location control, issue, return, valuation and the hand-off to Budget and Accounting.

Demand to payment

Each application owns one part of the chain; Store and Purchase connect the operational documents.

The complete business chain. Store & Purchase owns the operational middle; it does not replace Requests, Budget or Accounting.

Prepared from the current GRAV Store & Purchase navigation and workflows

Version date: 6 September 2026

Audience: Store team, buyers, requesters, department approvers, Finance, Accounting, auditors and system administrators

How to use this guide

Read Part I once to understand the system. Then use the workflow chapters while doing live work. The screen reference is for quick lookup; the checklists are for daily control.

If you are...	Start with	Then keep open
Store operator	Quick start; stock fulfilment; receiving; inventory operations	Daily Store checklist
Buyer	Purchase goods; services; suppliers and offers	Purchase-order and supplier-offer references
Requester or department approver	Requests; service acceptance; quantity/status vocabulary	Request Desk and Service Orders
Finance or Budget user	Budget and Accounting connection	Budget trace and exception reports
Accountant	Receipt/service evidence and supplier-voucher hand-off	Accounting boundary and matching checklist
Administrator	Masters, locations, permissions and setup checklist	Troubleshooting and legacy policy

Scope This guide describes the Store & Purchase application as it exists now. It distinguishes current operational screens from legacy records and does not pretend that Store is the accounting ledger or the costing engine.

Ten rules that prevent most mistakes

- Start demand in Request Desk. Do not create disconnected purchasing or stock activity when a request already exists.
- Choose the correct fulfilment path per line: reserve and issue existing stock, buy a physical item, or order a service.
- Use Materials for stock-tracked inputs, Finished products & BOM for the production catalogue, and Service master for non-stock work.
- Never type an opening or corrected stock balance into an item master. Stock changes through receipts, issues, returns, transfers, counts or adjustments.
- Never add quantities with different units. Metres, kilograms and pieces are separate measures unless a valid conversion exists.
- A purchase order orders goods; a goods receipt records what physically arrived and was accepted. They are not the same event.
- A service order never creates a goods receipt or stock movement. Completion must be reported and accepted.
- On hand is not available. Available is on hand less active reservations; picked stock has been prepared but not yet issued.
- Store supplies evidence to Budget and Accounting. Budget controls planned spend; Accounting posts the supplier voucher and payment.
- Use legacy screens only to read historical records or complete explicitly supported old work. Start new work in the current workflow.

Contents

Part	What it covers
I · System model	Purpose, ownership, vocabulary, navigation, roles and setup
II · Complete workflows	Stock fulfilment, goods purchasing, service purchasing, receiving, returns and counts
III · Screen-by-screen guide	Every current navigation entry, including reports, settings and legacy
IV · Cross-application control	Budget, Accounting, costing, audit and exception handling
V · Operating reference	Status meanings, troubleshooting, checklists, glossary and route map

Part I · Understand the system

1. What Store & Purchase is for

Store & Purchase is the operational record of physical materials and procured services. It connects an approved business need to a supplier order, records what arrived or what work was accepted, and maintains the movement and location evidence needed to know what the company can use.

The application owns

- Material identity, variants, units, reorder policy and stock-tracking attributes.
- Supplier identity and dated supplier offers for items, services and freight.
- Purchase orders for physical goods and service orders for non-stock work.
- Goods receipts, inspection outcomes, quarantine, put-away and supplier returns.
- Reservations, picking, issues, internal returns, transfers, cycle counts and immutable stock movements.
- Operational reports for movement, purchasing exceptions and management inventory valuation.

The application does not own

- The employee's original need or department approval — Requests owns that.
- The definition of budget heads, appropriations and available budget — Budget owns that.
- Supplier invoices, recoverable GST, payables and payment — Accounting owns that.
- Finished-product engineering and BOM authoring — Production owns that; Store reads the catalogue.
- Final product profitability or income tax — Central Costing and Accounting own those calculations.

2. Navigation map

1 Purchase navigation

Service orders sit beside purchase orders because services are ordered but never received into stock.

3 Refresh

Reloads the register. Use it after another user changes an order.

5 Search

Search by service order number, source request or supplier.

2 Page identity

The heading explains the document and explicitly states that no goods receipt or stock movement is created.

4 Status filters

Use the business state to narrow the queue. All returns the complete accessible register.

6 Explained failure

A failure banner must tell you what failed. Refresh only helps when the problem is temporary.

Annotated current screen. The same top navigation pattern is used throughout Store & Purchase.

Group	Screens	Question answered
Overview	Overview	What needs attention now?

Group	Screens	Question answered
Requests	Request desk	What does the business need, and how will each line be fulfilled?
Purchase	Purchase orders; Service orders; Purchase forms — legacy	What have we ordered from suppliers?
Receive	Goods receipts; Deliveries (legacy)	What arrived, what was accepted and where did it go?
Inventory	Reservations & picking; Issues & returns; Stock counts; Stock movements; Stock exceptions; Lot labels & barcodes	What stock is promised, moving, uncertain or traceable?
Masters	Materials; Finished products & BOM; Service master; Suppliers; Supplier offers; Units; Warehouses	What reusable records define our items, services, suppliers and locations?
Reports	Request register; Movement report; Purchase exceptions; Inventory valuation	What happened, what is late and what is the management value?
Settings	Store settings	Which defaults and operating policies apply?
Legacy & production	Old PO sheets and production-linked screens	How can historical/production records be read without using them as the new workflow?

3. Roles and separation of duties

Role	Normal work	Must not do
Requester	Describe the need, quantity, required date and justification; accept completed services	Choose a supplier or alter stock
Department approver	Confirm need and priority	Treat approval as proof of receipt
Store operator	Classify, reserve, pick, issue, receive, inspect, put away, return and count	Post supplier bills or payments
Buyer	Source offers, compare terms and issue orders	Invent item identity or bypass approved demand
Finance/Budget	Resolve heads, approve planned spend and monitor commitments	Edit quantities received
Accounting	Match evidence, post supplier vouchers and settle suppliers	Create warehouse movements

Role	Normal work	Must not do
Administrator	Maintain access, company context and controlled masters	Perform operational work merely to overcome a user's missing permission
Auditor/reader	Read records, history and reports	Use read access to perform transitions

Permission behaviour The screens and actions visible to a user depend on assigned capabilities. Being signed in is not the same as being authorised. Some mutations also need a linked staff identity because the history must name the person who acted.

4. Core vocabulary

Term	Exact meaning	Common confusion
Material	A physical, stock-tracked input or consumable.	Not a finished product or service.
Variant	A controlled version of a material, such as colour, size or grade.	Variant quantities may use different units and must not be summed blindly.
Request	The employee's need and approval record.	Not an order to a supplier.
Supplier offer	A dated, comparable price and terms from a supplier.	Not a live master price and not a purchase order.
Purchase order	The issued order for physical goods.	Does not prove delivery or acceptance.
Service order	The issued order for non-stock work.	Never creates stock.
Goods receipt	The factual record of goods received against a PO.	Not the supplier invoice.
Inspection	The decision to accept, quarantine or reject received quantity.	Not optional when the receipt requires control.
Put-away	Moving accepted stock into a usable warehouse location.	Unassigned stock is on hand but has no location.
Reservation	A promise of on-hand stock to approved demand.	Does not reduce on-hand quantity.
Pick	Preparing reserved stock for issue.	Picked stock has not left Store.
Issue	Confirming stock has left Store for the request/work.	This changes stock.
Supplier return	Sending rejected or damaged receipt quantity back to the supplier.	Different from unused issued material returning to Store.

Term	Exact meaning	Common confusion
Stock movement	Immutable evidence of a quantity change.	Corrections are compensating movements, not silent edits.

Inventory quantity states

Do not treat these figures as synonyms. Every operational decision depends on the distinction.

Quantity states. Quarantine and unassigned stock require their own operational decisions; they are not automatically available.

5. Before the first transaction

1. Confirm the company and site context shown by the application are correct. A record from another company must never be selected to solve a missing-data problem.
2. Create or verify units of measure and only the conversions the business can defend.
3. Create warehouses and locations, including receiving, inspection/quarantine, usable storage, returns and scrap locations as needed.
4. Create material records with a stable internal item code, base unit, category, reorder policy and variants.
5. Create services separately for non-stock work, subscriptions and charges; record the billing unit and classification.
6. Create suppliers and record their approved/active state.
7. Capture supplier offers so buyers compare dated facts rather than memory.
8. Confirm Finance has mapped item, service or category identities to budget heads. This mapping is not maintained on the material editor.
9. Confirm operational users have the capabilities for their duties and a linked staff identity where an action must be attributed.

Existing data If a register is unexpectedly empty after company scoping is enabled, do not recreate hundreds of masters. First check whether historical records lack company identity and require a controlled migration.

Part II · Complete workflows

6. Decide how to fulfil an approved request

The most important Store decision is made line by line. A single request may contain stockable materials, items that must be purchased and services that must be ordered.

1. Open Requests → Request desk and find the approved request by number, requester, department or status.
2. Open the record and read the need, quantity, unit, required date, notes and attachments before selecting an action.
3. For each line, identify whether it is a stock-tracked material, a non-stock service or an unresolved description that still needs classification.
4. For a material, select the exact material and variant. Check base unit, requested unit, on hand, active reservations and available quantity.
5. If enough usable stock is available, choose the stock-fulfilment path. The application should create or expose a reservation rather than treating approval as an issue.
6. If stock is insufficient or the item must be bought, choose the purchasing path and source/select an offer before creating the purchase order.
7. For non-stock work, match the line to Service master and create a service order after the required approvals.
8. Resolve the budget allocation before the approval gate that creates a commitment. An unresolved head is an exception, not a reason to assign an arbitrary head.
9. Confirm each line has one visible outcome and no duplicate operational document.

Decision guide

Question	Yes	No
Is it physical and stock tracked?	Material path	Service path
Is usable available stock sufficient?	Reserve → pick → issue	Purchase path
Is there a current comparable supplier offer?	Use it as sourcing evidence	Capture offers before selection
Has the budget identity resolved?	Proceed to the appropriate approval	Stop and resolve mapping/allocation
Has an order already been created for the same request line?	Open the existing order	Create only after all gates pass

7. Fulfil from existing stock

1. From Request Desk, open the approved material line and inspect availability by item, variant and location.
2. Create a reservation for the approved quantity. If only part is available, reserve only that part and keep the shortage visible.
3. Open Inventory → Reservations & picking. Filter to the request or reservation and review its state.
4. Select a source location containing usable stock. Quarantine, scrap and unassigned quantity must not be treated as freely available.
5. Pick the quantity. Picking records preparation; it does not yet reduce on hand.

6. Confirm issue only when the material physically leaves Store. This creates the stock movement and closes or reduces the reservation.
7. If unused material comes back, record an internal return against the issue. Do not create an unrelated positive adjustment.
8. Verify the request line, reservation, movement and location balances agree.

What can go wrong

- Available becomes lower between reservation and pick because another valid transaction posted; refresh and resolve the shortage.
- Requested and base units differ without an approved conversion; stop rather than assuming 1:1.
- The line is linked to the wrong variant; correct the classification before issue.
- A user tries to edit the original movement; use a reversal/corrective movement with a reason.

8. Purchase physical goods

Masters and documents

Masters define reusable identity. Documents record dated business events and keep historical snapshots.

Masters define identity; documents freeze the dated business event. A supplier offer belongs to sourcing, while a purchase order belongs to commitment and fulfilment.

1. Confirm the request line is an exact material/variant with a defensible quantity and unit.
2. Open Masters → Supplier offers and compare active offers for price, quoted unit, taxes/terms where recorded, lead time and validity.
3. Select the supplier based on the approved commercial decision. Record the reason when the lowest price is not selected.
4. Create the purchase order from the approved demand so request-line identity, item identity, quantity, unit, price and budget identity remain connected.
5. Review the draft: supplier, delivery destination, dates, lines, units, rate, taxes/charges as supported, terms and references.
6. Issue the purchase order. An issued order is a historical commercial commitment; do not silently overwrite it. Use cancellation or amendment where supported.

7. Monitor status and expected delivery. Use Purchase exceptions for overdue or inconsistent orders.
8. When goods arrive, receive against the purchase order. Never increase item stock directly to simulate a receipt.

Purchase-order completion check

- The supplier and company match.
- Every line points to the intended material and variant.
- Quantities and price units are explicit and convertible where necessary.
- The delivery warehouse/location is valid.
- The request line and budget allocation remain traceable.
- Issued, partially received, completed, cancelled or amended state is honest.

9. Receive, inspect and put away goods

1. Open Receive → Goods receipts, or use Receive from the purchase-order detail.
2. Choose the correct purchase order and verify supplier, item, variant and outstanding quantity.
3. Enter what physically arrived per PO line. Record quantity and unit at line level; never rely on a receipt-wide number that mixes units.
4. Record supplier invoice/delivery references, receipt date and destination as requested by the screen.
5. Submit the receipt once. If the response is uncertain, use the same retry path; do not create another receipt to be safe.
6. Inspect controlled goods. Mark accepted, quarantined/rejected and damaged quantities explicitly.
7. Put accepted stock into its actual usable location. Resolve any unassigned quantity instead of leaving it invisible to warehouse control.
8. Create a supplier return for rejected/damaged quantity when it is physically returned.
9. Verify the receipt lines, PO outstanding quantities, location balances and stock movements agree.

Partial, excess and mixed-unit receipts

- A partial receipt leaves an outstanding quantity on the PO; it does not close the line.
- An over-receipt is shown as quantity received beyond ordered, not as a negative remaining quantity.
- Two lines with no recorded unit are counted as two incomplete lines; their numbers are not totalled.
- A receipt with metres, kilograms and pieces has no meaningful receipt-wide quantity. Review each line or totals by unit.

10. Purchase and accept a service

1. Classify the request line against an active Service master record before Finance approval.
2. Confirm service code, name, billing unit, SAC/classification where recorded, supplier requirements and budget head.
3. Capture and compare service offers if the purchase requires sourcing.
4. Create the service order from the approved request. No stock item, warehouse or goods receipt is involved.
5. Issue the service order to the supplier and monitor Draft → Issued → In progress.
6. When the supplier reports completion, review the evidence, deliverable, period and quantity/rate basis.
7. The requesting department accepts the work or marks Rework required. Acceptance is the factual evidence Accounting needs.
8. Accounting matches the accepted service to the supplier voucher. Payment remains outside Store.

Service-order states

State	Meaning	Normal next action
Draft	Prepared but not sent as a binding order	Review and issue
Issued	Sent to the supplier	Supplier starts/acknowledges work
In progress	Work has started	Monitor delivery
Completion reported	Supplier says the work is complete	Requester verifies outcome
Accepted	Business accepts the delivered service	Accounting match
Rework required	Delivered work is not accepted	Supplier corrects and reports again
Cancelled	Order will not proceed	Record reason; no acceptance

Identity requirement Reading company-scoped Service Orders should depend on read permission. Mutating a service order still requires a linked staff record because the transition history must name the actor.

11. Transfer stock between locations

1. Confirm the source location, destination location, material, variant, quantity and unit.
2. Check that the source has sufficient usable on-hand quantity after active reservations.
3. Use the location transfer workflow; do not create a negative adjustment at the source and a positive adjustment at the destination.
4. Submit once and retain the operation reference. A retry must replay the same result, not post a second transfer.
5. Verify the paired movement evidence and both location balances.

12. Count and correct stock

1. Open Inventory → Stock counts and create a count for the intended warehouse/location and scope.
2. Choose normal or blind counting according to policy. In a blind count, counters should not be influenced by system quantity.
3. Record each observed item/variant with quantity and unit. Add unexpected stock explicitly rather than attaching it to a similar SKU.
4. Save progress, then submit for review. Review differences, unit issues, reservations and movement timing.
5. Approve/post the count only after the cut-off and evidence are sound.
6. Posting creates adjustment movements for accepted differences. It must not rewrite movement history.
7. Investigate material differences through Stock exceptions and document the reason.

Count controls

- Freeze or control movement timing around the count.
- Count by location and item identity, not by description alone.
- Do not convert missing units or variants by assumption.
- A zero count is an observation; a blank quantity is incomplete data.
- Recount large differences before posting.

13. Return flows

Return type	When used	Operational effect
Internal material return	Unused material returns from a department/work order	Adds usable stock back against the original issue
Supplier return	Rejected or damaged received goods go back to supplier	Reduces the appropriate received/quarantine quantity and preserves PO/receipt lineage
Cancellation before movement	A prepared action should not proceed	Changes document state; no stock movement should be invented
Correction after movement	A posted movement was wrong	Append a compensating/reversal movement with actor, time and reason

Part III · Screen-by-screen guide

14. Overview

Where to find it: Overview

The operational landing page. It should surface work that needs a decision instead of behaving as a decorative dashboard.

Use this screen when

- Beginning a Store or buyer shift
- Checking pending requests, receipts, shortages or exceptions
- Navigating to the next operational queue

How to use it

1. Read every attention card and its population/date scope.
2. Open the highest-risk queue first: blocked receipts, stock exceptions, overdue orders or approved demand without fulfilment.
3. Use links on the cards rather than recreating a filtered search manually.
4. Refresh after another user completes related work.

Before you consider the work complete

- Every urgent card is either acted on, assigned or acknowledged
- Counts reconcile with the destination register and filters

Avoid

- Treating the cards as accounting totals
- Ignoring the date or loaded-record scope of a figure

15. Request desk

Where to find it: Requests → Request desk

The working queue for approved demand. Store classifies each line and decides whether it will be fulfilled from stock, purchased as goods or ordered as a service.

Use this screen when

- An approved request reaches Store
- A request line is unresolved
- You need to inspect fulfilment, budget or downstream document lineage

How to use it

1. Search by request number, requester or department and narrow by status.
2. Open the request drawer/detail and read the requirement before choosing a master record.
3. Match each line to one material/variant or one service.
4. Review available stock and reservations for material lines.
5. Select the correct fulfilment action and retain the source request-line identity.
6. Resolve missing budget allocation with Finance before the commitment gate.
7. Confirm the downstream reservation, PO or service order is visible.

Before you consider the work complete

- Every active line has an honest classification and outcome
- Shortage and unresolved budget states remain visible
- No line was converted twice

Avoid

- Choosing a similar SKU because the exact material is missing
- Classifying a service as a material
- Using a legacy purchase form for new work

16. Purchase orders

Where to find it: Purchase → Purchase orders

The register and detail workspace for physical-goods orders.

Use this screen when

- Preparing, issuing or monitoring a PO
- Receiving against an order
- Reviewing partial receipt, cancellation or exception history

How to use it

1. Filter by status, supplier or search term.
2. Open the order and verify source request, supplier, item lines, units, rate, delivery destination and dates.
3. Issue only after commercial and budget gates are satisfied.
4. Use Receive for actual delivery; use cancellation/amendment actions for a changed commitment.
5. Review receipts and remaining quantities line by line.

Before you consider the work complete

- Issued document is historically stable
- Received/outstanding quantities make sense per unit
- Order and receipt references remain linked

Avoid

- Editing an issued commercial fact silently
- Recording services on a PO
- Treating All orders minus other statuses as a cancelled count

17. Service orders

Where to find it: Purchase → Service orders

The register for non-stock work from an approved service request through supplier completion and requester acceptance.

Use this screen when

- Ordering repairs, subscriptions, consulting, freight-like non-stock work or other services
- Monitoring completion or rework
- Providing acceptance evidence to Accounting

How to use it

1. Use status filters or search by order number, request or supplier.
2. Open the order and confirm service identity, scope, supplier, value/basis and requester.
3. Issue the order and move it to In progress when work starts.
4. Record completion evidence when the supplier reports completion.
5. Have the requesting department accept or require rework.
6. Refresh after another participant completes a transition.

Before you consider the work complete

- Accepted service has identifiable evidence and actor
- No goods receipt or stock movement exists
- The supplier voucher can trace the accepted service

Avoid

- Creating a GRN for a service
- Accepting work merely because an invoice arrived
- Retrying an explained staff-link blocker

Important The screen annotation earlier shows status filters, search and error behaviour. A temporary server failure may merit Refresh; an explained account or data blocker needs correction, not repeated retries.

18. Purchase forms — legacy

Where to find it: Purchase → Purchase forms — legacy

A historical register for purchase forms and petty-cash records created through the earlier material-request workflow.

Use this screen when

- Looking up an old form
- Downloading historical evidence
- Following a source-request link from an old record

How to use it

1. Search or filter the historical register.
2. Open a form to review line items, recorded petty cash, linked request and any linked PO.
3. Download the record if documentary evidence is required.
4. For new demand, leave this screen and use Request Desk.

Before you consider the work complete

- Historical figures are read with their register scope
- A converted form without a linked PO is not presented as if a PO exists

Avoid

- Creating new purchasing work here
- Assuming the first 200 loaded forms are the complete history
- Treating blank petty cash as zero

Important Legacy means retained historical workflow, not invalid data. New transactions should not be initiated through it.

19. Goods receipts

Where to find it: Receive → Goods receipts

The authoritative line-level register of physical goods received against purchase orders.

Use this screen when

- Receiving a PO
- Inspecting or putting away received goods
- Reviewing partial, excess, damaged, quarantined or returned quantity

How to use it

1. Start from the correct PO or select it in the receipt flow.
2. Enter actual quantity per line with unit and references.
3. Review before submitting; a receipt changes operational evidence.
4. Complete required inspection decisions.
5. Put accepted stock away into the actual location.
6. Open the receipt later to review line allocation, returns and movement evidence.

Before you consider the work complete

- Every number has an item and unit
- Accepted, rejected/quarantined and returned quantities reconcile
- No duplicate receipt was created on retry

Avoid

- Typing one total for mixed units
- Receiving the ordered quantity instead of the arrived quantity
- Leaving accepted stock unassigned indefinitely

20. Deliveries (legacy)

Where to find it: Receive → Deliveries (legacy)

A read-oriented view of older delivery records. Some historical rows contain only a receipt-wide quantity that cannot identify which PO lines arrived.

Use this screen when

- Investigating an old delivery
- Reading historical order-lifetime information
- Following return evidence on a legacy record

How to use it

1. Search and filter the register.
2. Expand a record and distinguish receipt contents from order-lifetime lines.
3. Where the screen says Not itemised, do not infer which items arrived.
4. Use the current Goods receipts workflow for new receiving.

Before you consider the work complete

- Mixed or missing units are not totalled
- Over-receipt is visible where computable
- Unitemised history remains labelled honestly

Avoid

- Using the unit-less aggregate as a reconciled receipt quantity
- Creating new work through the legacy screen

21. Reservations & picking

Where to find it: Inventory → Reservations & picking

The fulfilment queue between approved material demand and confirmed issue.

Use this screen when

- Allocating stock to a request
- Picking from locations
- Resolving shortage, expiry or cancellation

How to use it

1. Filter the queue to the request, status, item or date.
2. Open the reservation and check item, variant, requested quantity, reserved quantity and available stock.
3. Reserve from usable stock; keep any shortage explicit.
4. Pick from a real source location.
5. Confirm issue only when stock physically leaves.
6. Cancel/expire only with the recorded business reason.

Before you consider the work complete

- Reservation and pick never make stock negative
- Issue creates one immutable movement
- Request-line identity remains present

Avoid

- Treating reserved as issued
- Picking quarantine stock
- Submitting twice after an uncertain response

22. Issues & returns

Where to find it: Inventory → Issues & returns

The operational workspace for stock leaving Store and unused issued material returning.

Use this screen when

- Confirming an approved issue
- Recording an internal return
- Reviewing the history of an issue

How to use it

1. Prefer the reservation/picking path for request fulfilment.
2. Select exact material, variant, quantity, unit and source location.
3. Confirm the linked demand and recipient.
4. Submit the issue once.
5. For a return, reference the original issue and record the quantity physically returned.

Before you consider the work complete

- On-hand and location movements reconcile
- The request/issue/return chain is visible
- Correction evidence is append-only

Avoid

- Using a standalone issue to bypass a request
- Returning to an arbitrary SKU
- Editing the original movement

23. Stock counts

Where to find it: Inventory → Stock counts

The controlled cycle-count and stocktake workflow.

Use this screen when

- Starting a location count
- Recording observations
- Reviewing and posting count differences

How to use it

1. Create the count with warehouse, location, scope and count method.
2. Enter observations by exact item/variant and unit.
3. Save incomplete work; do not post it.
4. Submit for review and investigate differences.
5. Approve/post accepted differences to create movements.
6. Cancel an invalid count rather than manipulating observations to make it agree.

Before you consider the work complete

- Count status is correct
- Unexpected items and zero counts are explicit
- Every posted difference has actor, time and reason

Avoid

- Counting while uncontrolled movements continue
- Copying system quantity into a blind count
- Posting unexplained major differences

24. Stock movements

Where to find it: Inventory → Stock movements

The item/variant movement ledger used to explain how stock changed over time.

Use this screen when

- Investigating a balance
- Following receipt, issue, return, transfer or adjustment history
- Reviewing a corrective movement

How to use it

1. Search and select the exact item.
2. Choose All variants or one valid variant.
3. Apply direction/type/date filters and read the scope sentence.
4. Review each movement's date, type, quantity, unit, reference and location context.
5. Open the source document where available.

Before you consider the work complete

- Filtered rows are not mistaken for the whole balance
- Variant filters genuinely match the item
- Corrections point back to their originals

Avoid

- Calling a filtered net figure the current stock balance
- Summing across units
- Assuming row order proves an unbroken sequence

25. Stock exceptions

Where to find it: Inventory → Stock exceptions

The queue for inventory conditions requiring investigation or an operational correction.

Use this screen when

- Finding negative/uncertain balances, location gaps, blocked movements or control mismatches
- Assigning and resolving inventory follow-up

How to use it

1. Filter by exception type, severity, status, warehouse or item.
2. Open the exception and read the evidence and suggested next step.
3. Follow the source record rather than repairing the displayed symptom blindly.
4. Perform the legitimate receipt, transfer, return, count or corrective movement.
5. Resolve the exception only when evidence and balances agree.

Before you consider the work complete

- Resolution names the root cause and action
- No history was deleted
- Related exceptions are not left contradictory

Avoid

- Posting a manual adjustment before understanding the cause
- Closing an exception because the current balance looks plausible

26. Lot labels & barcodes

Where to find it: Inventory → Lot labels & barcodes

Creates traceable physical labels for received or stored quantities. Printing a label does not receive or adjust stock.

Use this screen when

- Labelling a lot, container or stored quantity
- Reprinting the latest created batch

How to use it

1. Select the item.
2. Choose a variant or explicitly choose Whole item / no variant.
3. Enter Quantity per label with unit.
4. Enter Number of labels and optional purchase-order reference.
5. Review item, SKU, variant, quantity per label, label count and PO reference.
6. Create and print. Use Reprint to reuse created IDs; Create another batch starts fresh.

Before you consider the work complete

- A label quantity is not multiplied into stock
- Every label carries the intended identity and unit
- A partial creation failure is understood before retry

Avoid

- Reading Number of labels as a stock quantity
- Printing a label to fix stock
- Recreating a successful batch because the print dialog failed

27. Materials

Where to find it: Masters → Materials

The stock-tracked item master for raw materials, consumables and other physical inputs used across purchase, Store and production.

Use this screen when

- Creating/editing a material
- Reviewing variants, reorder policy, supplier references or stock history
- Opening stock adjustment or PO actions from an item

How to use it

1. Search the register by item identity and use stock-status filters where needed.
2. Open an item to review base unit, category, reorder points, variants, supplier references and movements.
3. For a new item, enter name, category, base unit, reorder minimum and target maximum; the internal code is assigned on save.
4. Add controlled attributes/variants only when they change operational identity.
5. Save the item with zero stock. Enter opening or corrected quantity through a stock operation.

Before you consider the work complete

- Stable internal item code exists
- Base unit and category are correct
- Variants are counted, not added across mixed units
- Budget mapping is resolved in Finance, not assumed from this form

Avoid

- Creating duplicates for spelling differences

- Putting finished goods or services here
- Typing opening stock into the master
- Expecting budget-head fields on the item editor

28. Finished products & BOM

Where to find it: Masters → Finished products & BOM

A Store-facing, read-only view of the production catalogue and bill-of-material context.

Use this screen when

- Confirming the finished product a material demand belongs to
- Reading BOM context for issue, planning or costing traceability

How to use it

1. Search/select the finished product.
2. Review product identity, variants and BOM lines.
3. Follow production-owned links for engineering changes.
4. Use material masters and stock operations for physical inputs.

Before you consider the work complete

- The correct product/BOM version is being read
- No Store action is mistaken for BOM authoring

Avoid

- Editing production engineering from Store
- Using finished-product identity as a raw-material SKU

29. Service master

Where to find it: Masters → Service master

The reusable catalogue for non-stock work, subscriptions and charges.

Use this screen when

- Creating a service identity
- Classifying a service request
- Maintaining billing and tax classification

How to use it

1. Create a unique service code and clear business name.
2. Choose the billing unit that suppliers and requesters understand.
3. Record SAC/tax classification and default commercial information where supported.
4. Activate only when the service is ready for selection.
5. Retire/deactivate obsolete services without erasing historical orders.

Before you consider the work complete

- Requests can match the service before Finance approval
- The service never appears as on-hand stock
- Historical orders retain their frozen identity

Avoid

- Creating a material for non-stock work
- Using free text after a master exists
- Deleting a service used by history

30. Suppliers

Where to find it: Masters → Suppliers

The controlled master for organisations that provide goods or services.

Use this screen when

- Onboarding or reviewing a supplier
- Checking status, contacts or assessment
- Opening sourcing/order history

How to use it

1. Search for duplicates by legal/trade name and tax identity before creating.
2. Record legal identity, contact and commercial information.
3. Complete approval/assessment fields required by company policy.
4. Activate the supplier for new sourcing only after checks pass.
5. Deactivate rather than delete a supplier with history.

Before you consider the work complete

- Supplier belongs to the correct company
- Active status is justified
- Sensitive changes retain audit history

Avoid

- Creating one supplier per spelling or branch without policy
- Treating an inactive supplier as selectable
- Using supplier master price as a dated quotation

31. Supplier offers

Where to find it: Masters → Supplier offers

Dated sourcing evidence for materials, services and freight.

Use this screen when

- Comparing suppliers
- Recording a quoted unit/rate, lead time, terms or validity
- Selecting evidence for a PO or service order

How to use it

1. Choose Item, Service or Freight according to the thing quoted.
2. Select the supplier and exact master identity.
3. Record quoted quantity/unit, rate, currency/terms, lead time and validity where supported.
4. Compare like with like; convert units only through valid conversions.
5. Select the offer for the order and retain its snapshot.

Before you consider the work complete

- The offer was valid at selection time
- Quoted unit and order unit reconcile
- Selection reason is defensible

Avoid

- Overwriting old offers to make them current
- Comparing rates in incompatible units
- Treating an offer as proof of order or delivery

32. Units of measure

Where to find it: Masters → Units of measure

The controlled vocabulary and conversions used by items, offers, orders, receipts and movements.

Use this screen when

- Adding a unit
- Defining a conversion
- Diagnosing a unit mismatch

How to use it

1. Use an unambiguous name and symbol.
2. Define conversions only within a defensible measurement family or item-specific rule supported by the system.
3. Test both directions and zero/decimal behaviour.
4. Review affected item and offer records before changing an active conversion.

Before you consider the work complete

- Missing conversion causes a refusal, not silent 1:1
- Zero or invalid factors cannot pass
- Rendered quantities always show a unit or say it is missing

Avoid

- Converting metre to piece without an item-specific basis
- Reusing a symbol for different meanings
- Changing a factor to fix one transaction

33. Warehouses & locations

Where to find it: Masters → Warehouses

The physical hierarchy for receiving, inspection, usable storage, returns, quarantine and other controlled stock locations.

Use this screen when

- Creating warehouse structure
- Putting away, transferring or counting stock
- Reviewing capacity and location history

How to use it

1. Create the warehouse and its locations with clear codes and operational purpose.

2. Distinguish receiving/inspection/quarantine from usable pick locations.
3. Configure capacity only with compatible units and a defensible basis.
4. Use transfers/put-away to move stock between locations.
5. Retire locations only after active stock and work are resolved.

Before you consider the work complete

- Every on-hand quantity has a valid location or is explicitly Unassigned
- Quarantine cannot be picked as usable
- Location history is preserved

Avoid

- Using a warehouse total as a bin location
- Comparing capacity across incompatible units
- Deleting a location with stock/history

34. Material request register

Where to find it: Reports → Material request register

A report view of request demand and fulfilment status.

Use this screen when

- Reviewing request throughput
- Tracing a line to reservation, PO, receipt or issue
- Finding unresolved demand

How to use it

1. Set the required date/status/department filters.
2. Read the scope and loaded-result limit.
3. Open source or downstream documents for evidence.
4. Export only after filters and units are understood.

Before you consider the work complete

- Counts use the visible population
- Mixed units remain separate
- Unresolved lines are not hidden by summary totals

Avoid

- Calling a filtered count the all-time total
- Using the report to mutate source records

35. Movement report

Where to find it: Reports → Movement report

The reporting view of receipts, issues, returns, transfers, counts and adjustments.

Use this screen when

- Period review
- Movement-type analysis
- Audit support

How to use it

1. Choose company/site, period, item/variant and movement type as required.
2. Read quantity with unit and value basis separately.
3. Drill to source documents for unusual movements.
4. Export the filtered population with its scope.

Before you consider the work complete

- Opening/closing logic and filters are understood
- Correction pairs are included
- No filtered net is called on-hand balance

Avoid

- Summing quantities across units
- Assuming report order proves no missing movement

36. Purchase exceptions

Where to find it: Reports → Purchase exceptions

The control queue for overdue, blocked, inconsistent or incomplete purchasing activity.

Use this screen when

- Chasing late orders
- Finding unmatched receipt/order conditions
- Prioritising buyer follow-up

How to use it

1. Filter by exception type, age, supplier or owner.
2. Open the source PO/service order/receipt.
3. Resolve the actual operational condition.
4. Refresh and confirm the exception clears or records the remaining reason.

Before you consider the work complete

- Each exception has an owner and next action
- False completion is not used to make the queue green

Avoid

- Closing an order simply because it is old
- Treating a supplier delay as a stock adjustment

37. Inventory valuation

Where to find it: Reports → Inventory valuation

A management valuation based on accepted operational movements, including landed-cost overlays where available.

Use this screen when

- Reviewing inventory value
- Explaining base versus landed value
- Identifying missing valuation evidence

How to use it

1. Choose the valuation date and required scope.
2. Review quantity, base value and landed/effective value separately.
3. Drill to receipt and landed-cost allocation evidence.
4. Treat missing or unavailable inputs as exceptions, not zero cost.

Before you consider the work complete

- Values use accepted/applied movements only
- Variant and receipt identity are distinguishable
- Management valuation is not presented as statutory closing stock

Avoid

- Using off-bill manual charges as landed cost
- Allocating recoverable GST into product cost
- Calling an estimate the accounting ledger

38. Settings

Where to find it: Settings

Company/site defaults and Store operating preferences.

Use this screen when

- Reviewing configuration before go-live
- Changing a documented operating default

How to use it

1. Read the current value and the business process it controls.
2. Confirm who will be affected.
3. Change one policy at a time with approval.
4. Test the downstream request/order/receipt behaviour.

Before you consider the work complete

- The change is documented and effective from a known date
- Historical records retain their original facts

Avoid

- Using settings to repair one bad transaction
- Changing defaults without testing live workflow

39. Legacy & production group

This group is deliberately separated from the current operational journey. It includes PO sheets (legacy print), work-order sheets, machine operations, devices & machines and assigned team.

Screen type	Use it for	Do not use it for
PO sheets — legacy print	Printing or reading older PO sheet formats	Starting a new purchasing workflow

Screen type	Use it for	Do not use it for
Work-order sheets	Reading/printing production-linked work information	Replacing Request Desk or Store reservations
Machine operations	Production execution context	Recording supplier purchases
Devices & machines	Production equipment records	Material item identity
Assigned team	Production staffing context	Store access administration

Legacy policy Legacy records remain valid history. Restrict new creation, retain read/search/export needed for audit, and migrate outstanding work deliberately. Do not delete old records merely because the current workflow is better.

Part IV · Budget, Accounting and costing

40. Where budget sits

Budget and Accounting connection

Budget controls planned spend. Accounting owns posted actuals and payments. Store retains operational context.

The item-wise budget chain. The budget allocation belongs to the request/commitment identity; the Store item editor is not the budget-maintenance screen.

Budget is the financial control layer around planned spend. Store supplies the operational identity — item or service, quantity, supplier order and acceptance evidence — but the budget application decides which head and period fund the line and whether enough budget is available.

Item-wise and service-wise allocation

1. A material or service is mapped to a default budget head through Finance-controlled mapping. A more specific item override takes precedence over a category/default mapping.
2. When a request line is created/classified, the system resolves the allocation and stores the chosen head, period and resolution evidence.
3. Approval creates or updates a commitment against that budget. The commitment is planned/approved spend, not an accounting actual.
4. The PO or service order carries the request-line and allocation identity downstream.
5. An accepted receipt or accepted service establishes the factual operational quantity.
6. Accounting posts the supplier voucher. That posting is the actual financial event; recoverable GST remains separate from product/service cost.
7. The budget commitment releases or settles against the posted actual according to Budget rules.

Why you do not see budget on Add item The material editor defines reusable stock identity. Putting a budget head there as an editable Store field would let Store redefine Finance policy. Budget mapping and exceptions belong in Finance/Budget screens; Store should show the resolved result on the request/order trace where it matters.

41. Store to Accounting hand-off

Evidence	Store responsibility	Accounting use
Purchase order	Approved supplier, item/service, quantity, rate and terms	Commercial match
Goods receipt	Actual physical quantity received and accepted/rejected	Quantity match and accrual evidence
Service acceptance	Requester confirms delivered work	Service quantity/completion match
Supplier return	Quantity and reason returned	Debit-note/credit adjustment evidence
Landed-cost allocation	Traceable allocation to eligible receipts	Management valuation support; accounting treatment remains Accounting's
Supplier voucher	Not created by Store	Posted payable, tax and actual expense/inventory
Payment	Not created by Store	Supplier ledger settlement

Three-way match for goods

- PO: what the company authorised and ordered.
- Accepted receipt: what physically arrived and was accepted.
- Supplier voucher: what the supplier billed and Accounting posted.

Two-way operational match for services

- Service order: authorised scope/rate/basis.
- Service acceptance: what the requesting department accepted.
- Accounting then matches the supplier voucher to both.

42. Relationship to full product costing

Store provides material quantity and valuation evidence, service/freight/procurement context and receipt-level landed cost. Central Costing combines this with operations, labour, packaging, freight, duty, financing, development and overhead policy to estimate and freeze product cost. Income tax is assessed after profit; it is not hidden inside product cost.

Question	Owning answer
What material and quantity is required?	BOM/production plus material master
What did it cost to acquire?	Accepted receipt valuation plus eligible landed-cost allocation
What service/freight was consumed?	Service order/acceptance and costing policy
What overhead should the product absorb?	Central Costing policy and coverage

Question	Owning answer
What was actually invoiced and paid?	Accounting
What budget funded it?	Budget allocation, commitment and settlement
Is selling price minus cost cash in pocket?	No. Profitability must also consider overhead, financing, tax and timing; Accounting confirms realised results.

Part V · Operating reference

43. Status and next-action reference

Object/state	What it tells you	Next action
Request · approved	Need is authorised	Store classifies and chooses fulfilment
Reservation · active	Stock is promised	Pick when ready
Pick · prepared	Stock is staged	Confirm issue when it leaves
PO · draft	Not yet a binding issued order	Review and issue
PO · issued	Supplier order is live	Monitor/receive/amend/cancel
PO · partly received	Some quantity arrived	Receive balance or resolve exception
Receipt · pending inspection	Goods arrived but usability is undecided	Inspect
Receipt · accepted	Quantity may be put away/valued	Put away and match
Receipt · quarantined/rejected	Not usable stock	Review, rework or supplier return
Service · completion reported	Supplier says work is complete	Requester accepts or requires rework
Service · accepted	Operational delivery is confirmed	Accounting match
Count · review	Observations differ or await approval	Investigate and post/cancel
Exception · open	Control condition is unresolved	Follow evidence and correct root cause

44. Troubleshooting

What you see	Likely cause	What to do
Register is empty, but records used to exist	Filters, company scoping, or historical rows without company identity	Clear filters; verify company/site; ask admin to audit migration—do not recreate masters
Access denied / action hidden	Capability is missing	Confirm assigned Store role/capability; do not use another person's login
Account is not linked to staff	Login has no Employee record for attributable mutations	Ask admin to link the account to the correct employee
Service orders could not be loaded	Temporary API error or explained data blocker	Read the banner; Refresh only for a temporary failure
Unit conversion unavailable	No valid conversion exists	Correct the master/transaction unit; never assume 1:1
Insufficient available stock	On hand is reserved, quarantined or in another location	Review Reservations, location stock and shortage path
Stock exists but cannot be picked	Wrong variant/location/status or unassigned/quarantine state	Use exact identity and put-away/inspection workflow
Receipt quantity looks wrong	Mixed units, legacy aggregate or over-receipt	Review line-level figures by unit
Save/submit result was uncertain	Connection dropped after request started	Use the same retry action/key and check history before creating anything new
Record changed while open	Another user updated it	Refresh, reread and retry the decision from current state
Budget head unresolved	No valid item/service/category mapping	Finance resolves mapping or an authorised override
Inventory value missing	Receipt/value/landed-cost evidence is incomplete	Follow the valuation exception; do not substitute zero
Old screen says legacy	Historical workflow	Read/export old records; begin new work in current screens

45. Daily Store checklist

- Open Overview and Stock exceptions; assign urgent blockers.
- Process approved requests due soon.
- Review reservations waiting to be picked and picks waiting to be issued.
- Receive scheduled deliveries against the correct POs.
- Complete inspections and put-away; clear unassigned accepted stock.
- Record internal returns and supplier returns promptly.

- Review negative/uncertain/location exceptions before shift close.
- Confirm no uncertain retry created a duplicate transaction.

46. Daily buyer checklist

- Review purchase shortages and approved demand awaiting sourcing.
- Capture/refresh dated supplier offers.
- Issue approved POs and service orders.
- Follow overdue or at-risk orders in Purchase exceptions.
- Resolve supplier, unit, rate or validity anomalies before issue.
- Coordinate receipt/service acceptance without marking it complete on another team's behalf.

47. Weekly control checklist

- Review slow/open requests, partial POs and old reservations.
- Reconcile quarantined, unassigned and returns locations.
- Run movement and purchase-exception reports with documented scope.
- Review material reorder policy and supplier-offer expiry.
- Perform scheduled cycle counts and investigate differences.
- Review inactive/duplicate suppliers, materials and services without deleting history.
- Review unresolved budget mappings and accounting match blockers.

48. Month-end checklist

- Ensure all goods received by cut-off have line-level receipts and inspection outcomes.
- Ensure accepted services have acceptance evidence.
- Complete or explain open supplier returns and material internal returns.
- Reconcile material/location movements and investigate exceptions.
- Provide Accounting the PO–receipt/service acceptance trail.
- Review management inventory valuation and missing-cost exceptions.
- Separate operational estimates from posted Accounting actuals.

49. Administrator setup checklist

- Company and site context resolves for every Store user.
- Operational users have least-privilege capabilities and linked staff identities for mutations.
- Materials, services and finished products remain separate masters with clear ownership.
- Units and conversions are controlled and tested.
- Warehouse/location hierarchy reflects real physical flow.
- Suppliers have lifecycle status and audit history.
- Budget mappings cover active item/service/category identities.
- Historical records are migrated to company scope before legacy fallback is removed.
- Legacy creation paths are restricted; historical read/export remains available.
- Backups, audit retention and period-end controls are documented outside this user guide.

50. Glossary

Abbreviation/term	Meaning
BOM	Bill of materials: the product's defined material requirements.

Abbreviation/term	Meaning
GRN / Goods receipt	Goods receipt note/record for physical arrival against a PO.
MRF / Material request	A department's request for material; current work is handled through Request Desk.
PO	Purchase order for physical goods.
SO / Service order	Order for non-stock work; not a sales order in this context.
SKU / Item code	Stable internal identifier for a material or variant.
SAC	Service accounting classification used for service tax/accounting context.
On hand	Physical quantity recorded in Store.
Available	On hand less active reservations, subject to usability/location rules.
Landed cost	Eligible acquisition charges allocated to accepted receipts for management valuation.
Commitment	Approved planned spend reserved against a budget.
Actual	Financial amount posted by Accounting, normally through the supplier voucher.
Idempotent retry	Repeating the same operation safely without duplicating its business effect.
Immutable movement	A posted stock fact that is corrected by a linked compensating movement, not overwritten.

51. Route and ownership map

Navigation	Typical path	Owner
Overview	/store/dashboard/overview	Store operations
Request desk	/store/dashboard/operations/mrf-history	Requests + Store decision
Purchase orders	/store/dashboard/operations/purchase-order	Purchase
Service orders	/store/dashboard/operations/service-orders	Purchase + requester acceptance
Purchase forms — legacy	/store/dashboard/operations/requisitions	Historical

Navigation	Typical path	Owner
Goods receipts	/store/dashboard/operations/goods-receipts	Receive/Store
Deliveries (legacy)	/store/dashboard/operations/delivery	Historical
Reservations & picking	/store/dashboard/operations/reservations-picking	Store
Issues & returns	/store/dashboard/raw-items/stock-adjustments	Store
Stock counts	/store/dashboard/operations/stock-counts	Store control
Stock movements	/store/dashboard/operations/stock-ledger	Store/audit
Stock exceptions	/store/dashboard/operations/stock-exceptions	Store control
Lot labels & barcodes	/store/dashboard/operations/barcode-generator	Store
Materials	/store/dashboard/raw-items	Item master
Finished products & BOM	/store/dashboard/finished-products	Production-owned; Store read
Service master	/store/dashboard/service-master	Service master
Suppliers	/store/dashboard/vendors-buyer/vendors	Supplier master
Supplier offers	/store/dashboard/vendor-offers	Sourcing
Units of measure	/store/dashboard/units	Master data
Warehouses	/store/dashboard/warehouses	Warehouse master
Reports	/store/dashboard/reports/...	Read/control
Settings	/store/dashboard/settings	Administration

52. Final operating test

A user is ready to operate the application only if they can answer all of the following without guessing:

- Where does a new need start, and who approves it?
- How do I decide between stock fulfilment, a purchase order and a service order?
- What is the difference between on hand, reserved, available, picked and issued?
- How do I receive a mixed-unit PO without inventing a meaningless total?
- What makes a service complete, and why is there no GRN?
- Where do material, service, supplier, offer, unit and warehouse masters live?

- Why is budget mapping not edited on the material form?
- Which event is the Accounting actual, and who records payment?
- How do I correct a posted stock error without editing history?
- Which screens are legacy, and what work may still be done there?

If any answer is unclear, return to the corresponding workflow chapter before performing the transaction. In Store & Purchase, correct identity and correct sequence are more valuable than a fast but disconnected entry.
